1E G protein coupled, 5 hydroxytryptamine 1E receptor, 5-HT-1E, 5-hydroxytryptamine receptor	
1E, HTR1E, S31, Serotonin receptor 1E, 5HT1E_HUMAN.	
Background: The members of the G-protein-coupled receptor family are distinguished by their	
slow transmitting response to ligand binding. These seven transmembrane proteins include the	
adrenergic, serotonin and dopamine receptors. The effect of the signaling molecule can be	
excitatory or inhibitory depending on the type of receptor to which it binds. b-adrenergic bound	
to adrenaline activates adenylyl cyclase, while a2-adrenergic receptor bound to adrenaline	
inhibits adenylyl cyclase. Like the a2-adrenergic receptor, serotonin receptor functions are also	
mediated by G proteins that inhibit the activity of adenylyl cyclase. The serotonin receptors	
have been classified into several categories, designated SR-17 (5HT17). Subtypes within the	
SR-1 group include SR-1A, -1B, -1D, -1E and -1F.	

Pathways:

JAK-STAT Signaling, cAMP Metabolic Process
