	purinoceptor 10, P2Y-like receptor, P2Y10, P2Y10_HUMAN, Purinergic receptor P2Y G protein
	coupled 10, Putative P2Y purinoceptor 10.
	Background: Nucleotides are important extracellular signaling molecules that mediate several
	events, such as cell proliferation, differentiation, chemotaxis and cytokine release. The P2
	receptor family is activated by the binding of nucleotides and is divided into two subfamilies,
	designated P2X and P2Y. The P2Y receptor family are G protein-coupled receptors that mediat
	the effects of extracellular nucleotides, primarily through the activation of phospholipase C
	(PLC). To some extent, the P2Y receptors can also activate potassium channels or,
	alternatively, inhibit adenylate cyclase and N-type calcium channels in response to extracellula
	nucleotides. P2Y10 (purinergic receptor P2Y, G-protein coupled, 10), also known as P2RY10, is
	a 339 amino acid multi-pass membrane protein that is thought to act as a receptor for purines
	coupled to G-proteins. P2Y10 is found at low levels in blood leukocytes and is upregulated
	during promyelocytic cell differentiation.
