KCNG1_HUMAN.Background: Voltage-gated potassium (Kv) channels represent the most complex class of
voltage-gated ion channels from both functional and structural standpoints. Their diverse
functions include regulating neurotransmitter release, heart rate, insulin secretion, neuronal
excitability, epithelial electrolyte transport, smooth muscle contraction, and cell volume. This
gene encodes a member of the potassium channel, voltage-gated, subfamily G. This gene is
abundantly expressed in skeletal muscle. Multiple alternatively spliced transcript variants have
been found in normal and cancerous tissues. [provided by RefSeq, Jul 2008].
