Target Details

| Background: | Synonyms: pH Z 10, pH Z10, Zinc finger protein 131, ZN131_HUMAN, ZNF 131, Znf131. |
|-------------|---|
| | Background: Zinc-finger proteins contain DNA-binding domains and have a wide variety of |
| | functions, most of which encompass some form of transcriptional activation or repression. The |
| | majority of zinc-finger proteins contain a Kruppel-type DNA binding domain and a KRAB |
| | domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. |
| | As a member of the krueppel C2H2-type zinc-finger protein family, ZNF131 (Zinc finger protein |
| | 131) is a 623 amino acid nuclear protein that contains one BTB (POZ) domain and six C2H2- |
| | type zinc fingers. With predominant expression found in brain, it is likely that ZNF131 plays a |
| | role as a transcription regulator during development and organogenesis of the adult central |
| | nervous system. ZNF131 also represses ER Alpha (Estrogen receptor alpha)-mediated |
| | transactivation by interrupting ER?binding to the estrogen-response element. There are two |
| | isoforms of ZNF131 that are produced as a result of alternative splicing events. |
| Gene ID: | 7690 |
