Background:	Synonyms: pH Z 10, pH Z10, Zinc finger protein 131, ZN131_HUMAN, ZNF 131, Znf131.	
	Background: Zinc-finger proteins contain DNA-binding domains and have a wide variety of	
	functions, most of which encompass some form of transcriptional activation or repression. The	
	majority of zinc-finger proteins contain a Kruppel-type DNA binding domain and a KRAB	
	domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins.	
	As a member of the krueppel C2H2-type zinc-finger protein family, ZNF131 (Zinc finger protein	
	131) is a 623 amino acid nuclear protein that contains one BTB (POZ) domain and six C2H2-	
	type zinc fingers. With predominant expression found in brain, it is likely that ZNF131 plays a	
	role as a transcription regulator during development and organogenesis of the adult central	
	nervous system. ZNF131 also represses ER Alpha (Estrogen receptor alpha)-mediated	
	transactivation by interrupting ER?binding to the estrogen-response element. There are two	
	isoforms of ZNF131 that are produced as a result of alternative splicing events.
