	Background: Zinc-finger proteins contain DNA-binding domains and have a wide variety of
	functions, most of which encompass some form of transcriptional activation or repression. The
	majority of zinc-finger proteins contain a Kr_ppel-type DNA binding domain and a KRAB
	domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins.
	As a member of the krueppel C2H2-type zinc-finger protein family, ZNF704 is a 412 amino acid
	nuclear protein that contains one C2H2-type zinc finger. The gene encoding ZNF704 maps to
	human chromosome 8, which is made up of nearly 146 million bases and encodes about 800
	genes. Chromosome 8 is also associated with Pfeiffer syndrome, congenital hypothyroidism
	and Waardenburg syndrome.
