| | Background: This gene, a muscle member of the immunoglobulin gene superfamily, encodes | |
| | myosin light chain kinase which is a calcium/calmodulin dependent enzyme. This kinase | |
| | phosphorylates myosin regulatory light chains to facilitate myosin interaction with actin | |
| | filaments to produce contractile activity. This gene encodes both smooth muscle and | |
| | nonmuscle isoforms. In addition, using a separate promoter in an intron in the 3' region, it | |
| | encodes telokin, a small protein identical in sequence to the C-terminus of myosin light chain | |
| | kinase, that is independently expressed in smooth muscle and functions to stabilize | |
| | unphosphorylated myosin filaments. A pseudogene is located on the p arm of chromosome 3. | |
| | Four transcript variants that produce four isoforms of the calcium/calmodulin dependent | |
| | enzyme have been identified as well as two transcripts that produce two isoforms of telokin. | |
| | Additional variants have been identified but lack full length transcripts. [provided by RefSeq, Jul | |
