Background:	Synonyms: SEB, MRD29, SET-binding protein, SETBP1, KIAA0437	
	Background: SETBP1 (SET binding protein 1), also known as SEB, is a 1,542 amino acid nuclear	
	protein that contains three AT hook DNA-binding domains, one SKI homology region and a C-	
	terminal SET-binding domain, which is followed by three PPLPPPP repeats. SETBP1 may be	
	involved in SET-related tumorigenesis and leukemogenesis by regulating the transforming	
	activity of SKI in the nucleus or suppressing SET function. As a widely expressed protein,	
	SETBP1 is encoded by a gene that maps to human chromosome 18, which houses over 300	
	protein-coding genes and contains nearly 76 million bases. There are a variety of diseases	
	associated with defects in chromosome 18-localized genes, some of which include Trisomy 18	
	(also known as Edwards syndrome), Niemann-Pick disease, hereditary hemorrhagic	
	telangiectasia, erythropoietic protoporphyria and follicular lymphomas.
