### Target Details

Background:	Synonyms: Myf-5, bHLHc2, Class C basic helix loop helix protein 2, Class C basic helix-loop-		
	helix protein 2, Myf 5, Myf-5, Myf5, MYF5_HUMAN, Myogenic factor 5.		
	Background: Differentiation of myogenic cells is regulated by multiple positively and negatively		
	acting factors. One well characterized family of helix-loop-helix (HLH) proteins known to play an		
important role in the regulation of muscle cell development include Myo D, myc			
and Myf-6 (also designated MRF-4 or herculin). Of interest, most muscle cells expr			
	Myo D or Myf-5 in the committed state, but when induced to differentiate, all turn on expression		
of myogenin. Myo D transcription factors form heterodimers with products of a n expressed family of bHLH genes, the E family, which consists of at least three dis			
	that are functionally important elements in the upstream regulatory sequences of many		
	muscle-specific terminal differentiation genes.		
Gene ID:	4617		
UniProt:	P13349		
Pathways:	Regulation of Muscle Cell Differentiation, Skeletal Muscle Fiber Development
