Background: F-box proteins are critical components of the SCF (Skp1-CUL-1-F-box protein) type
E3 ubiquitin ligase complex and are involved in substrate recognition and protein recruitment.
F-box proteins are members of a large family that regulate the cell cycle, immune response,
signaling cascades and developmental programs by targeting proteins, such as cyclins, for
degradation by the proteasome after ubiquitination. FBL11, also known as FBXL11 (F-box and
leucine-rich repeat protein 11), CXXC8, KDM2A, JHDM1A (JmjC domain-containing histone
demethylation protein 1A) or LILINA, is a 1,162 amino acid member of the F-box protein family
that contains one F-box domain and localizes to the nucleus. Expressed ubiquitously with
highest expression in testis, ovary and brain, FBL11 functions to demethylate the Lys-36 residue
of histone H3, thereby modulating the histone code. Additionally, FBL11 is thought to promote
the ubiquitination and subsequent degradation of various phosphorylated proteins. Three
isoforms of FBL11 exist due to alternative splicing events.
