protein 11, Carbonic anhydrase-related protein 2, CARP XI, CARP-2, CARP2.
Background: Carbonic anhydrases (CAs) are members of a large family of zinc metalloenzymes
responsible for catalyzing the reversible hydration of carbon dioxide. CAs show extensive
diversity in their distribution and subcellular localization. They are involved in a variety of
biological processes, including calcification, bone resorption, respiration, acid-base balance and
the formation of aqueous humor, saliva, gastric juice and cerebrospinal fluid. CA XI, also
referred to as carbonic anhydrase-related protein 11 precursor (CA-RP XI) or carbonic
anhydrase-related protein 2 (CA-RP II), is a member of the carbonic anhydrase family that lacks
two of the three Zn-binding motifs essential for carbonic anhydrase activity. For this reason, CA
XI does not exhibit catalytic activity. It is expressed primarily in brain but is also found in spinal
cord and thyroid. CA XI may play a role in brain development. Tissue specificity: Expressed
abundantly in the brain with moderate expression also present in spinal cord and thyroid.
