dehydrogenase/reductase family 7C member 5, DHR13_HUMAN.
Background: DHRS13 (dehydrogenase/reductase SDR family member 13), also known as
UNQ419/PR0853, is a 377 amino acid secreted protein belonging to the short-chain
dehydrogenases/reductases (SDR) family. DHRS13 is presumed to function as an
oxidoreductase and is phosphorylated, potentially by ATM or ATR, upon DNA damage. DHRS13
exists as two isoforms produced by alternative splicing events. The gene encoding DHRS13
maps to human chromosome 17, which comprises over 2.5 % of the human genome and
encodes over 1,200 genes. Neurofibromatosis, dysregulated Schwann cell growth, Alexander
disease, Birt-Hogg-Dube syndrome and Canavan disease are associated with chromosome 17.
