	leucine-rich repeat LGI family member 4, Leucine rich repeat LGI family member 4, LGI1 like
	protein 3, LGI4, Lgi4 protein, Lgil3, LGI4_HUMAN.
	Background: LGI4, also known as leucine-rich glioma-inactivated protein 4, is a 537 amino acid
	secreted glycosylated protein that is widely expressed, with highest levels found within the
	nervous system. Interestingly, siRNA knockdown studies of LGI4 expression in Schwann cells
	have been shown to result in the inhibition of myelination, thus suggesting that LGI4 is an
	essential component of myelin formation and axon segregation. LGI4 shares significant
	homology with its other family members, LGI1, LGI2 and LGI3. Significantly, mutations in the
	gene encoding LGI1 have been linked to human temporal lobe epilepsy and, given the sequence
	similarity of LGI4, it is likely that it also may be implicated in the pathology of seizures. LGI4 is
	localized subcellularly to the Golgi, ER and vesicles. There are two isoforms of LGI4 that are
	produced as a result of alternative splicing events.
