| Background: UBE2H, also known as UBC8, UBCH, UBCH2 or E2-20K, is a 183 amino acid              |
| protein involved in ubiquitin-mediated protein degradation. Ubiquitination is an important     |
| mechanism through which three classes of enzymes act in concert to target short-lived or       |
| abnormal proteins for destruction. The three classes of enzymes involved in ubiquitination are |
| the ubiquitin-activating enzymes (E1s), the ubiquitin-conjugating enzymes (E2s) and the        |
| ubiquitin-protein ligases (E3s). One of several members of the ubiquitin-conjugating enzyme    |
| family, UBE2H functions as an E2 ubiquitin-conjugating enzyme that acts to catalyze the        |
| covalent attachment of ubiquitin residues to various proteins, including Histone H2A. UBE2H    |
| shares 100 % identity with its mouse counterpart and 98 % identity with its frog and zebrafish |
| homologs, suggesting a conserved function between species. Multiple isoforms of UBE2H exist    |
| due to alternative splicing events.  |
