|                     | Background: GFOD2 is a 385 amino acid secreted protein of the extracellular matrix that                     |
|                     | belongs to the gfo/idh/mocA family. Existing as two alternatively spliced isoforms, GFOD2                   |
|                     | enhances matrix assembly and is encoded by a gene that maps to human chromosome                             |
|                     | 16q22.1. Chromosome 16 encodes over 900 genes and comprises nearly 3 % of the human                         |
|                     | genome. The GAN gene is located on chromosome 16 and, with mutation, may lead to giant                      |
