Background:	Synonyms: F box only protein 36, F box protein 36, F-box only protein 36, Fbx 36, Fbx36,
	FBX36_HUMAN, FBXO 36, Fbxo36, FLJ37592, FLJ41090.
	Background: FBXO36 is a 188 amino acid protein that contains one forty amino acid F-box
	region, making it a member of the F-box family. F-box proteins are critical components of the
	SCF (Skp1-CUL-1-F-box protein) type E3 ubiquitin ligase complex and are involved in substrate
	recognition and recruitment for ubiquitination. F-box proteins are members of a large family
	that regulates cell cycle, immune response, signaling cascades and developmental programs
	by targeting proteins, such as cyclins, cyclin-dependent kinase inhibitors, IkB-å and -catenin, for
	degradation by the proteasome after ubiquitination. Functioning as a component of the SCF
	complex, FBXO36 is thought to recognize and bind to select phosphorylated proteins, thereby
	promoting their ubiquitination and subsequent degradation.
