	Background: Adipogenesis, the process of transforming pre-adipocytes into mature fat cells, is		
	of particular interest due to the role adipocytes play in obesity and type II diabetes. Adipocytes		
	have been shown to affect a variety of functions, including hemostasis, angiogenesis and		
	energy balance, by secreting hormones and bioactive peptides. The FNDC3B protein, also		
	designated FAD104 (factor for adipocyte differentiation 104) or HCV NS5A-binding protein 37,		
	is expressed during early adipogenesis. Belonging to the FNDC3 family of proteins, FNDC3B is a		
	1,204 amino acid protein that contains nine fibronectin type-III domains. FNDC3B-deficient		
	mice die within one day of birth, suggesting that FNDC3B is crucial for postpartum survival.		
	Mouse embryonic fibroblasts (MEFs) with loss of FNDC3B function displayed a reduction in		
	stress fiber formation, indicating a role for FNDC3B in cell proliferation, adhesion, spreading and		
	migration.
