	that human chromosome 2 is the result of an ancient fusion of two ancestral chromosomes	
	vestigial second centromere and vestigial telomeres which gives credence to the hypothesis	
	mutations in the ALMS1 gene. Interestingly, chromosome 2 contains what appears to be a	
	ABCG5 and ABCG8. An extremely rare recessive genetic disorder, Alstr syndrome is due to	
	mutations in the ABCA12 gene. The lipid metabolic disorder sitosterolemia is associated with

	up approximately 8 % of the human genome. A number of genetic diseases are linked to genes	
	human chromosome 2, which consists of 237 million bases encoding over 1,400 genes, making	
	a role in coordinating an aspect of bone turnover. The gene that encodes SPP24 maps to	
	protein that belongs to the cystatin superfamily. Expressed in liver and plasma, SPP24 may play
