	Background: C-type lectin that functions as cell-surface receptor for a wide variety of ligands
	such as damaged cells, fungi and mycobacteria. Plays a role in the recognition of pathogenic
	fungi, such as Candida albicans. The detection of mycobacteria is via trehalose 6,6'-dimycolate
	(TDM), a cell wall glycolipid. Specifically recognizes alpha-mannose residues on pathogenic
	fungi of the genus Malassezia. Recognizes also SAP130, a nuclear protein, that is released by
	dead or dying cells. Transduces signals through an ITAM-containing adapter protein, Fc
	receptor gamma chain /FCER1G. Induces secretion of inflammatory cytokines through a
	pathway that depends on SYK, CARD9 and NF-kappa-B.
