Background:	Synonyms: AF1Q, ALL1 fused gene from chromosome 1q, MLLT 11, MLLT-11,	
	Myeloid/lymphoid or mixed lineage leukemia trithorax homolog, Drosophila translocated to 11,	
	Protein AF1q, RP11 316M1.10.	
	Background: The gene encoding the Mixed-Lineage Leukemia (MLL) proteins is located on	
	chromosome 11q23. Chromosomal translocations involving band 11q23 result in rogue	
	activator proteins that are associated with approximately 10 % of patients with acute	
	lymphoblastic leukemia (ALL) and 5 $\%$ of patients with acute myeloid leukemia (AML). Most	
	patients affected are less than 1 year of age. MLLT11, also known as mixed-lineage leukemia	
	translocated to 11 or AF1q, is a 90 amino acid MLL fusion partner. Based on the expression	
	patterns of MLLT11, it is thought that MLLT11 plays a role in leukemogenesis and, specifically,	
	the progression of acute monocytic leukemia (AML). Also, expressed in embryonic brain cortex	
	MLLT11 is upregulated during neuronal differentiation and is thought to play a role in the	
	development of the central nervous system. Finally, MLLT11 has been shown to be	
	differentially expressed in highly metastatic cells, in comparison with non-metastatic parent	
	cells. Such findings suggest a role of MLLT11 in tumorigenesis.
