## Target Details

Background:	<p>Synonyms: Fibrous sheath interacting protein 1, FLJ35989, HSD10, FSIP1_HUMAN.</p> <p>Background: FSIP1 is a 581 amino acid protein that is expressed in airway epithelium. A member of the FSIP1 family, FSIP1 is encoded by a gene that maps to human chromosome 15q14 and mouse chromosome 2 E5. Encoding more than 700 genes, chromosome 15 is made up of approximately 106 million base pairs and is about 3 % of the human genome. Angelman and Prader-Willi syndromes are associated with loss of function or deletion of genes in the 15q11-q13 region. In the case of Angelman syndrome, this loss is due to inactivity of the maternal 15q11-q13 encoded UBE3A gene in the brain by either chromosomal deletion or mutation. In cases of Prader-Willi syndrome, there is a partial or complete deletion of this region from the paternal copy of chromosome 15. Tay-Sachs disease is a lethal disorder associated with mutations of the HEXA gene, which is encoded by chromosome 15. Marfan syndrome is associated with chromosome 15 through the FBN1 gene.</p>
