|-------------|---|
| | Background: FSIP1 is a 581 amino acid protein that is expressed in airway epithelium. A |
| | member of the FSIP1 family, FSIP1 is encoded by a gene that maps to human chromosome |
| | 15q14 and mouse chromosome 2 E5. Encoding more than 700 genes, chromosome 15 is |
| | made up of approximately 106 million base pairs and is about 3 % of the human genome. |
| | Angelman and Prader-Willi syndromes are associated with loss of function or deletion of genes |
| | in the 15q11-q13 region. In the case of Angelman syndrome, this loss is due to inactivity of the |
| | maternal 15q11-q13 encoded UBE3A gene in the brain by either chromosomal deletion or |
| | mutation. In cases of Prader-Willi syndrome, there is a partial or complete deletion of this region |
| | from the paternal copy of chromosome 15. Tay-Sachs disease is a lethal disorder associated |
| | with mutations of the HEXA gene, which is encoded by chromosome 15. Marfan syndrome is |
| | associated with chromosome 15 through the FBN1 gene. |
