Background:	Synonyms: PTC, PTC bitter taste receptor, T2R38, T2R61, taste receptor, type 2, member 38,	
zaongrodina.	T2R38_HUMAN.	
	Background: The sense of taste is essential for the survival of organisms. For example, the	
	ability to identify sweet-tasting foods enables animals to seek out food with high nutritive value,	
	whereas the ability to identify bitter substances enables them to avoid the ingestion of	
	potentially harmful substances. A family of integral membrane proteins are involved in taste	
	perception and include T1R, which is involved in sweet taste perception and T2R, which is	
	involved in bitter taste perception. Both types of taste receptors couple to various G proteins to	
	initiate signal transduction cascades. Specifically, T2R38 is expressed in subsets of taste	
	receptor cells of the tongue and exclusively in gustducin-positive cells. Variations in T2R38 are	
	associated with the ability to taste the bitter chemical phenylthiocarbamide (PTC), also called	
	thiourea tasting.
