Target Details	
Target:	Arylsulfatase H (ARSH)
Alternative Name:	ARSH (ARSH Products)
Background:	Synonyms: Arylsulfatase H, ASH, ARSH_HUMAN.
	Background: Sulfatases hydrolyze sulfate esters from sulfated steroids, carbohydrates,
	proteoglycans and glycolipids. They are involved in hormone biosynthesis, modulation of cell
	signaling and degradation of macromolecules. Arylsulfatase H, also known as ARSH, is a 562

	amino acid protein that belongs to the sulfatase family of bone and cartilage matrix proteins.
	Localized to the plasma membrane, Arylsulfatase H uses calcium as a cofactor to hydrolyze
	sulfate esters. The gene encoding Arylsulfatase D maps to human chromosome X, which
	contains nearly 153 million base pairs and houses over 1,000 genes. In conjunction with
	chromosome Y, chromosome X is responsible for sex determination. There are a number of
	conditions related to an abnormal number and combination of sex chromosomes, some of
	which include Turner's syndrome, color blindness, hemophilia and Duchenne muscular
	dystrophy.
