| | Background: Members of the suppressor of cytokine signaling (SOCS) family of proteins contain C-terminal regions of homology called the SOCS box, which serves to couple SOCS proteins and their binding partners with the Elongin B/C complex. Several other families of proteins also contain SOCS boxes, but differ from the SOCS proteins in the type of domain they |
|---------------------|---|
| | contain upstream of the SOCS box. The largest family of SOCS box-containing proteins is the |
| | ankyrin repeat and SOCS box-containing (ASB) protein family. ASB-13 (ankyrin repeat and SOCS |
| | box-containing 13) is a 278 amino acid member of the ASB family that contains one SOCS box |
| | domain and six ANK repeats. Existing as multiple isoforms, ASB-13 functions as a substrate- |
| | recognition component of an E3 ubiquitin-protein ligase complex and, working in conjunction |
| | with other proteins, plays a role in the ubiquitination and subsequent proteasomal degradation of target proteins. |
