	its central region and a consensus-binding motif for PDZ domains at its C-terminus. It was	
	identified in silico as a homolog of the protein known as LNX1 or SEMCAP1, which possesses	
	ubiquitin ligase activity and binds the membrane protein Semaphorin 4C. However, PDZRN3	
	itself has not previously been characterized. We have now evaluated the properties and	
	functions of PDZRN3. The PDZRN3 gene was shown to be expressed in various human tissues	
	including the heart, skeletal muscle and liver and its expression in mouse skeletal muscle was	
	developmentally regulated. Both the differentiation of C2C12 mouse skeletal myoblasts into	
	myotubes and injury-induced muscle regeneration in vivo were found to be accompanied by up-	
	regulation of PDZRN3. The differentiation-associated increase in the expression of PDZRN3 in	
	C2C12 cells follows that of myogenin and precedes that of myosin heavy chain. Depletion of	
	PDZRN3 by RNA interference inhibited the formation of myotubes as well as the associated up-	
	regulation of myosin heavy chain in C2C12 cells. Our data suggest that PDZRN3 plays an	
	essential role in the differentiation of myoblasts into myotubes by acting either downstream or	
	independently of myogenin.
