Background: The members of the murine Cdx family (Cdx1, Cdx2, and Cdx4) are members of
the caudal-type homeobox family of genes, which are homologues of the Drosophila caudal?
gene required for anterior-posterior regional identity. The intestine-specific transcription factors
Cdx1 and Cdx2 are candidate genes for directing intestinal development, differentiation,
proliferation and maintenance of the intestinal phenotype. The relative expression of Cdx1 to
Cdx2 protein may be important in the anterior to posterior patterning of the intestinal epithelium
and in defining patterns of proliferation and differentiation along the crypt-villus axis.
Expression of the Cdx1 homeobox gene in epithelial intestinal cells promotes cellular growth
and differentiation. Cdx1 positively regulates its own expression. Cdx1 and Cdx2 are expressed
in the small intestine and colon of fetus and adult. A decrease in human Cdx1 and/or Cdx2 $$
expression is associated with colorectal tumorigenesis. Both Cdx1 and Cdx2 genes must be
expressed to reduce tumorigenic potential, to increase sensitivity to apoptosis and to reduce
cell migration, suggesting that the two genes control the normal phenotype by independent
pathways. The human Cdx1 gene maps to chromosome 5q31-q33 and encodes a 265-amino
acid protein.
