	basic leucine zipper domain-containing protein, ASZ1
	Background: Plays a central role during spermatogenesis by repressing transposable elements
	and preventing their mobilization, which is essential for the germline integrity. Acts via the
	piRNA metabolic process, which mediates the repression of transposable elements during
	meiosis by forming complexes composed of piRNAs and Piwi proteins and governs the
	methylation and subsequent repression of transposons. Its association with pi-bodies suggests
	a participation in the primary piRNAs metabolic process. Required prior to the pachytene stage
	to facilitate the production of multiple types of piRNAs, including those associated with repeats
	involved in the regulation of retrotransposons. May act by mediating protein-protein
	interactions during germ cell maturation (By similarity).
