| | Background: Ubiquitin-dependent proteolysis mediates selective destruction of various cell |
| | cycle regulators, transcription factors and tumor suppressors. In eukaryotic cells, selective |
| | breakdown of cellular proteins is ensured by their ubiquitination and subsequent degradation by |
| | the 26S proteasome. At specific stages of development, embryo- and tissue-specific |
| | components of the 26S proteasome form, facilitating proteolysis. 20S Proteasome ?, also |
| | designated macropain subunit C2 or PROS-30, is a prosomal protein involved in a non- |
| | lysosomal ATP/ubiquitin-dependent proteolytic pathway. The entire proteasome is composed |
| | of at least 15 non-identical subunits which form a highly-ordered ring-shaped structure. |
| Gene ID: | 5682 |
| Pathways: | Mitotic G1-G1/S Phases, DNA Replication, Synthesis of DNA |
