	Background: Core component of the CAF-1 complex, a complex thought to mediate chromatin
	assembly in DNA replication and DNA repair. Assembles histone octamers onto replicating DNA
	in vitro. CAF-1 performs the first step of the nucleosome assembly process, bringing newly
	synthesized histones H3 and H4 to replicating DNA, histones H2A/H2B can bind to this
	chromatin precursor subsequent to DNA replication to complete the histone octamer. CHAF1A
	binds to histones H3 and H4. It may play a role in heterochromatin maintenance in proliferating
	cells by bringing newly synthesized cbx proteins to heterochromatic DNA replication foci (By
	similarity). The CCR4-NOT complex functions as general transcription regulation complex. Also
	involved in vitamin D-coupled transcription regulation via its association with the WINAC
	complex, a chromatin-remodeling complex recruited by vitamin D receptor (VDR), which is
	required for the ligand-bound VDR-mediated transrepression of the CYP27B1 gene.
