pathway to Golgi and/or centrosomes.Myomegalin, is a 2,346 amino acid protein that contains one NBPF domain and localizes to the nucleus, cytoplasm, centrosome and Golgi apparatus. Expressed at high levels in fetal and adult heart and at lower levels in brain and placenta,
Expressed at high levels in fetal and adult heart and at lower levels in brain and placenta,
myomegalin is thought to function as an anchoring protein that sequesters members of the
cAMP-dependent pathway to the Golgi and to centrosomes, thereby mediating cAMP pathway
dynamics. Translocations in the gene that encodes myomegalin are associated with
myeloproliferative disorders (MBDs), a group of diseases caused by an overproduction of blood
cells. Myomegalin exists as twelve isoforms due to alternative splicing events.
