	of antibiotics available, beta-lactams are used for the treatment of bacterial infections usually
	caused by gram-positive organisms. Beta-lactam antibiotics are bactericidal, functioning to
	inhibit the synthesis of the peptidoglycan layer of bacterial cell walls. Bacterial penicillin-binding
	proteins and beta-lactamases constitute a large family of serine proteases that perform
	essential functions in the synthesis and maintenance of peptidoglycan cell wall. Notably, beta-
	lactamases cleave beta-lactams, therefore providing the bacteria with resistance to the
	antibiotic. Homologues of beta-lactamases occur in many species, including human, rat, cow,
	rabbit, pig, xenopus, zebrafish, and C. elegans. The human homologues, LACTB and LACTB2,
	are active-site-serine enzymes thought to be involved in metabolism.
