| development.Transcription factor 25, is a 676 amino acid protein that plays a role in cell death. |
|---|
| A member of the TCF25 family, Nulp1 utilizes its C-terminus to mediate transcriptional |
| repression of SRF in vitro, and interacts with XIAP. Nulp1 localizes primarily to the nucleus but |
| is also found in cytosol. Widely expressed, Nulp1 is found at high levels in embryonic brain and |
| adult heart. The gene encoding Nulp1 maps to human chromosome 16, which encodes over |
| 900 genes and comprises nearly 3 % of the human genome. The GAN gene is located on |
| chromosome 16 and, with mutation, may lead to giant axonal neuropathy, a nervous system |
| disorder characterized by increasing malfunction with growth. The rare disorder Rubinstein- |
| Taybi syndrome is also associated with chromosome 16, as is Crohn's disease, which is a |
| gastrointestinal inflammatory condition. |
