Target Details

Background: C14orf106 is required for recruitment of CENPA to centromeres and normal chromosome segregation during mitosis. It interacts with SP1. There are two isoforms. Chromosome 14 contains about 700 genes and 106 million base pairs and makes up about 3.5 % of human cellular DNA. Chromosome 14 encodes the presenilin 1 (PSEN1) gene, which is one of the three key genes associated with the development of Alzheimer's disease. The SERPINA1 gene is located on chromosome 14 and when defective leads to the genetic disorder α -antitrypsin deficiency. This disorder is characterized by severe lung complications and liver dysfunction. Notably, the immunoglobulin heavy chain locus is found on chromosome 14 and has been identified as a fusion with the chromosome 19 encoded protein BCL3 in the (14,19) translocations found in a variety of B cell malignancies. The C14orf106 gene product has been provisionally designated C14orf106 pending further characterization.
