	Background: PDZD9 (PDZ domain containing 9) is a 264 amino acid protein that contains one
	PDZ (DHR) domain and participates in protein binding. Conserved in chimpanzee, dog, cow,
	mouse and rat, PDZD9 exists as two alternatively spliced isoforms and is encoded by a gene
	that maps to human chromosome 16p12.1. Chromosome 16 encodes over 900 genes,
	approximately 90 million base pairs, makes up nearly 3 $\%$ of human cellular DNA and is
	associated with a variety of genetic disorders. Giant axonal neuropathy, a nervous system
	disorder characterized by increasing malfunction with growth, and the rare disorder Rubinstein-
	Taybi syndrome, characterized by mental retardation and predisposition to tumor growth and
	white blood cell neoplasias, are associated with chromosome 16. Crohn's disease, a
	gastrointestinal inflammatory condition, and systemic lupus erythematosis are also associated
	with chromosome 16.
