## Target Details

	human chromosome 17. Chromosome 17 makes up over 2.5 % of the human genome with
	about 81 million bases encoding over 1,200 genes. Two key tumor suppressor genes are
	associated with chromosome 17, namely, p53 and BRCA1. Tumor suppressor p53 is necessary
	for maintenance of cellular genetic integrity by moderating cell fate through DNA repair versus
	cell death. Malfunction or loss of p53 expression is associated with malignant cell growth and
	Li-Fraumeni syndrome. Like p53, BRCA1 is directly involved in DNA repair, specifically it is
	recognized as a genetic determinant of early onset breast cancer and predisposition to cancers
	of the ovary, colon, prostate gland and fallopian tubes. Chromosome 17 is also linked to
	neurofibromatosis, a condition characterized by neural and epidermal lesions, and dysregulated
	Schwann cell growth. Alexander disease, Birt-Hogg-Dube syndrome and Canavan disease are
	also associated with chromosome 17.
