	Background: The type II integral membrane (ITM2) protein family consists of three members
	ITM2A (also designated E25), ITM2B and ITM2C. ITM2A expression is high in osteogenic and
	lymphoid tissues, while both ITM2B and ITM2C are expressed in brain. Mutations in the ITM2B
	gene can lead to familial British dementia (fbd), and autosomal dominant disease characterized
	by progressive dementia, spasticity, and cerebellar ataxia, or familial Danish dementia (fdd), an
	autosomal dominant disorder characterized by cataracts, deafness, progressive ataxia, and
	dementia. The ITM2A 263-amino acid protein contains an N-terminal cytosolic domain, an
	uncleaved signal anchor sequence, and a tyrosine-rich C-terminal domain. Human ITM2A
	shares 91 % homology with mouse ITM2A.
