### Target Details

Target:	C4orf14
Alternative Name:	C4orf14 ( <a href="#">C4orf14 Products</a> )
Background:	Synonyms: mAtNOS1, Chromosome 4 open reading frame 14, hAtNOS1, Hypothetical protein LOC84273, MGC3232, Putative ortholog of Arabidopsis mitochondrial nitric oxide synthase, Uncharacterized protein C4orf14, NOA1_HUMAN. Background: Representing approximately 6 % of the human genome, chromosome 4 contains

nearly 900 genes. Notably, the Huntingtin gene, which is found to encode an expanded glutamine tract in cases of Huntington's disease, is on chromosome 4. FGFR-3 is also encoded on chromosome 4 and has been associated with thanatophoric dwarfism, achondroplasia, Muenke syndrome and bladder cancer. Chromosome 4 is also tied to Ellis-van Creveld syndrome, methylmalonic acidemia and polycystic kidney disease. Chromosome 4 reportedly contains the largest gene deserts (regions of the genome with no protein encoding genes) and has one of the two lowest recombination frequencies of the human chromosomes. The C4orf14 gene product has been provisionally designated C4orf14 pending further characterization.
