Target Details

Background:	Synonyms: Beta-tectorin, Tectb, TECTB_HUMAN, Tectorin beta.
	Background: Beta-tectorin is a 329 amino acid secreted protein that contains one zona
	pellucida (ZP) domain. While it may form homomeric filaments after self-association, Beta-
	tectorin may also form heteromeric filaments when it associates with ?tectorin. The presence
	of a hydrophobic C-terminus preceded by a potential cleavage site strongly suggests that
	tectorins are synthesized as glycosylphosphatidylinositol-linked, membrane-bound precursors.
	Tectorins are targeted to the apical surface of the inner ear epithelia and proteolytically
	released into the extracellular compartment. Beta-tectorin is one of the major non-collagenous
	components of the tectorial membrane. The tectorial membrane is an extracellular matrix of
	the inner ear that covers the neuroepithelium of the cochlea and contacts the stereocilia
	bundles of specialized sensory hair cells. Sound induces movement of these hair cells relative
	to the tectorial membrane, deflects the stereocilia and leads to fluctuations in hair-cell
	membrane potential, transducing sound into electrical signals.

Pathways:

Sensory Perception of Sound
