	exocytosis 3, Regulating synaptic membrane exocytosis protein 3, RIMS 3, RIMS-3, RIM 3,		
	RIM3, RIM3 gamma, RIMS3, RIMS3_HUMAN.		
	Background: Rab 3, a neural/neuroendocrine-specific member of the Rab family, is involved in		
	Ca2+-regulated exocytosis and functions in an inhibitory capacity, controlling the recruitment		
	and pooling of secretory vesicles at the plasma membrane. The Rim (Rab 3 interacting		
	molecule) family of proteins (Rim1, Rim2, Rim3 and Rim4) are multidomain adaptors that		
	regulate Rab 3 activity and sub-sequent neurotransmitter release. Rim3, also known as RIMS3		
	(regulating synaptic membrane exocytosis 3) or NIM3, is a 308 amino acid member of the Rim		
	family. Localized to the synapse and to cell junctions, Rim3 contains one C2 domain and is		
	thought to play an important role in the regulation of synaptic membrane exocytosis. Rim3, a		
	protein that may be phosphorylated upon DNA damage, is expressed throughout the body with		
	highest levels present in brain tissue.
