	NCPD HI IMANI Debudrodeliebul dinkeenhete sunthees sempley subunit NU 91. Cis	
	NGBR_HUMAN, Dehydrodolichyl diphosphate synthase complex subunit NUS1, Cis-	
	prenyltransferase subunit NgBR, Nogo-B receptor.	
	Background: Nogo is an oligodendrocyte-specific member of the Reticulon family and is a	
	component of CNS white matter that inhibits axon outgrowth, induces collapse of growth	
	cones of chick dorsal root ganglion cells, and inhibits the spreading of 3T3 fibroblasts. Nogo is	
	expressed by oligodendrocytes but not by Schwann cells and associates primarily with the	
	endoplasmic reticulum. Nogo exists in three different splice forms, Nogo-A, -B and -C. NgBR	
	(Nogo-B receptor), also known as nuclear undecaprenyl pyrophosphate synthase 1 homolog, is	
	a 293 amino acid single-pass type I membrane protein that acts as a specific receptor for the	
	amino-terminus of Nogo-B. Through this interaction, NgBR is involved in the regulation of	
	vascular remodeling and angiogenesis. NgBR also enhances Niemann-Pick type C2 protein	
	(NPC2) stabilization. Knockdown of NgBR mRNA leads to decreased NPC2 levels, which results	
	in the hallmarks of NPC2 mutation: increased intracellular cholesterol accumulation and a loss	
	of sterol sensing.
