member 2, APBA2, APBA2\_HUMAN, D15S1518E, HsT16821, LIN 10, Mint 2, Mint-2, Neuron-specific X11L protein, Neuronal Munc18-1-interacting protein 2, Phosphotyrosine binding/interacting domain PTB bearing protein, X11 beta, X11L.

Background: The Beta-Amyloid precursor protein (Beta-APP) is a major constituent of the amyloid deposits in patients with Alzheimer's disease. The Beta-Amyloid precursor is known to interact with several proteins, including X11 and the G heterotrimeric protein APP-BP1. The neuronal, transmembrane protein X11 is known to bind to the -Amyloid precursor protein via a phosphotyrosine binding (PTB) domain, reducing the secretion of cellular Beta-APP and slowing Beta-APP processing pathways. X11 binds specifically to the YENPTY motif, which is involved in the internalization of Beta-APP. Multiple splice variants of X11 have been identified, including X11 Alpha (also designated Mint 1), X11 Beta (Mint 2) and X11 Gamma (Mint 3).
