| Quantity:            | 100 μL   |  |
|----------------------|--|--|
| Target:              | FICD   |  |
| Binding Specificity: | AA 161-250   |  |
| Reactivity:          | Mouse  |  |
| Host:                | Rabbit   |  |
| Clonality:           | Polyclonal   |  |
| Conjugate:           | This FICD antibody is conjugated to Cy7  |  |
| Application:         | Western Blotting (WB), Immunofluorescence (Cultured Cells) (IF (cc)), Immunofluorescence (Paraffin-embedded Sections) (IF (p)) |  |

### Product Details

| Immunogen:            | KLH conjugated synthetic peptide derived from human HYPE |  |
|-----------------------|--|--|
| Isotype:              | IgG  |  |
| Cross-Reactivity:     | Mouse  |  |
| Predicted Reactivity: | Human,Rat,Dog,Sheep,Pig,Horse                            |  |
| Purification:         | Purified by Protein A.                                   |  |

## **Target Details**

| Target:           | FICD                       |
|-------------------|----------------------------|
| Alternative Name: | HYPE/HIP13 (FICD Products) |

#### **Target Details**

#### Background:

containing, FIC domain containing protein, FIC domain-containing protein, Fic S phase protein cell division homolog, ficd, FICD\_HUMAN, HIP-13, HIP13, Huntingtin interacting protein 13, Huntingtin interacting protein E, Huntingtin interactor protein E, Huntingtin yeast partner E, Huntingtin-interacting protein 13, Huntingtin-interacting protein E. Background: Huntingtin yeast partner E is a 458 amino acid single-pass membrane protein. HYPE is thought to interact with Huntingtin, a protein which induces neurodegeneration when mutated. HYPE also contains two tetratricopeptide repeats (TPR), which may be involved in protein-protein interaction. The gene that encodes HYPE is located on chromosome 12, which encodes over 1,100 genes within 132 million bases and makes up about 4.5 % of the human genome. A number of skeletal deformities are linked to chromosome 12 including hypochondrogenesis, achondrogenesis and Kniest dysplasia. Chromosome 12 is also home to a homeobox gene cluster which encodes crucial transcription factors for morphogenesis, and the natural killer complex gene cluster encoding C-type lectin proteins which mediate the NK cell response to MHC I interaction. Trisomy 12p leads to facial development defects, seizure disorders and a host of other symptoms varying in severity depending on the extent of mosaicism and is most severe in cases of complete trisomy.

Synonyms: Adenosine monophosphate-protein transferase FICD, AMPylator FICD, FIC domain

#### **Application Details**

IF(IHC-P) 1:50-200

IF(IHC-F) 1:50-200

IF(ICC) 1:50-200

Restrictions:

For Research Use only

#### Handling

| Freservative: ProClin  | Tranding           |  |
|--|--------------------|--|
| Buffer:  Aqueous buffered solution containing 0.01M TBS (pH 7.4) with 1 % BSA, 0.03 % Proclin300 a 50 % Glycerol.  Preservative:  ProClin  Precaution of Use:  This product contains ProClin: a POISONOUS AND HAZARDOUS SUBSTANCE, which should handled by trained staff only. | Format:            | Liquid   |
| 50 % Glycerol.  Preservative: ProClin  Precaution of Use: This product contains ProClin: a POISONOUS AND HAZARDOUS SUBSTANCE, which should handled by trained staff only.  | Concentration:     | 1 μg/μL  |
