	Background: RPGRIP1L is a 1,315 amino acid protein that belongs to the RPGRIP1 family and is
	thought to function in programmed cell death, craniofacial development and formation of the
	left-right axis. Existing as two alternatively spliced isoforms that localize to the cytoplasm,
	cytoskeleton, centrosome and cilium basal body, RPGRIP1L interacts with nephrocystin-4 and
	is moderately expressed in brain, retina and kidney. Containing two C2 domains, RPGRIP1L is
	encoded by a gene that maps to human chromosome 16q12.2. Defects in the gene encoding
	RPGRIP1L are the cause of Joubert syndrome type 7 (JBTS7), COACH syndrome (COACHS)
	and Meckel syndrome type 5 (MKS5).
Pathways:	DNA Replication, Regulation of G-Protein Coupled Receptor Protein Signaling, Synthesis of DNA
