Background:	Synonyms: ATD4, JBTS11, Nbla10696, NPHP12, Putative protein product of Nbla10696,		
	Tetratricopeptide repeat protein 21B, THM1, TPR repeat protein 21B, TT21B_HUMAN, Ttc21b.		
	Background: The tetratricopeptide repeat (TPR) motif is a degenerate, 34 amino acid sequence		
	found in many proteins and acts to mediate protein-protein interactions in various pathways. At		
	the sequence level, there can be up to 16 tandem TPR repeats, each of which has a helix-turn-		
	helix shape that stacks on other TPR repeats to achieve ligand binding specificity. TTC21B		
	(tetratricopeptide repeat domain 21B), also known as THM1, is a 1,316 amino acid protein that		
	contains 19 TPR repeats and belongs to the TTC21 family. Localizing to cytoplasm and		
	cytoskeleton, TTC21B exists as two alternatively spliced isoforms and is thought to negatively		
	regulate Shh signal transduction. TTC21B may also be involved in retrograde intraflagellar		
	transport in cilia, and is encoded by a gene that maps to human chromosome 2q24.3.		
Gene ID:	79809		
UniProt:	Q7Z4L5		
Pathways:	Hedgehog Signaling
