	FBN2_HUMAN, fibrillin 2 congenital contractural arachnodactyly, Fibrillin-2.
	Background: Extracellular glycoproteins fibrillin-1 and -2 are major components of connective
	tissue microfibrils. Fibrillin-2 containing microfibrils regulate the early process of elastic fiber
	assembly in tissue. Mutations in the fibrillin-2 gene resulting in impaired assembly of fibrillin-2
	may lead to molecular congenital contractural arachnodactyly. Fibrillin-2 constitutes the
	backbone of microfibrils which insert directly into the lamina densa of basement membranes.
	Epithelial cells primarily deposit fibrillin into the extracellular matrix in a nonfibrillar form.
	Mutations in the 8-cysteine motif of Fibrillin-2 alters its binding to microfibril-associated
	glycoprotein-1 (MAGP-1), which may increase the severity of congenital contractural
	arachnodactyly.
Pathways:	Maintenance of Protein Location, SARS-CoV-2 Protein Interactome
