#### **Target Details**

Background: Zinc-finger proteins contain DNA-binding domains and have a wide variety of functions, most of which encompass some form of transcriptional activation or repression. The majority of zinc-finger proteins contain a Kr\_ppel-type DNA binding domain and a KRAB domain, which is thought to interact with KAP1, thereby recruiting histone modifying proteins. ZNF786 (zinc finger protein 786) is a 782 amino acid protein that belongs to the Kr\_ppel C2H2-type zinc-finger protein family and is thought to function in transcriptional regulation. Localizing to nucleus, ZNF786 contains sixteen C2H2-type zinc fingers, a single KRAB domain and is encoded by a gene that maps to human chromosome 7q36.1.
