	protein 11, Carbonic anhydrase-related protein 2, CARP XI, CARP-2, CARP2.
	Background: Carbonic anhydrases (CAs) are members of a large family of zinc metalloenzymes
	responsible for catalyzing the reversible hydration of carbon dioxide. CAs show extensive
	diversity in their distribution and subcellular localization. They are involved in a variety of
	biological processes, including calcification, bone resorption, respiration, acid-base balance and
	the formation of aqueous humor, saliva, gastric juice and cerebrospinal fluid. CA XI, also
	referred to as carbonic anhydrase-related protein 11 precursor (CA-RP XI) or carbonic
	anhydrase-related protein 2 (CA-RP II), is a member of the carbonic anhydrase family that lacks
	two of the three Zn-binding motifs essential for carbonic anhydrase activity. For this reason, CA
	XI does not exhibit catalytic activity. It is expressed primarily in brain but is also found in spinal
	cord and thyroid. CA XI may play a role in brain development.Tissue specificity:Expressed
	abundantly in the brain with moderate expression also present in spinal cord and thyroid.
