domain-containing protein 54, ANR54_HUMAN, LIAR.
Background: ANKRD54 is a 300 amino acid protein that contains four ankyrin repeats and is
expressed as two alternatively spliced isoforms. The gene encoding human ANKRD54 maps to
chromosome 22, which houses over 500 genes and is the second smallest human
chromosome. Mutations in several of the genes that map to chromosome 22 are involved in
the development of Phelan-McDermid syndrome, neurofibromatosis type 2, autism and
schizophrenia. Additionally, translocations between chromosomes 9 and 22 may lead to the
formation of the Philadelphia chromosome and the subsequent production of the novel fusion
protein BCR-Abl, a potent cell proliferation activator found in several types of leukemias.
