Ubiquitination is an important mechanism<br>through which three classes of enzymes act in concert to target short-lived or abnormal<br>proteins for destruction. The three classes of enzymes involved in ubiquitination are the<br>ubiquitin-activating enzymes (E1s), the ubiquitin-conjugating enzymes (E2s) and the ubiquitin-<br>protein ligases (E3s). As an E2 class enzyme, UBE2W (Ubiquitin-conjugating enzyme E2 W),<br>also known as Ubiquitin carrier protein W, is a 151 amino acid that catalyzes the conjugation of<br>ubiquitin to proteins that are meant for lysosomal degradation. Functioning as a homodimer,<br>UBE2W is widely expressed, with highest levels in testis. There are two isoforms of UBE2W that<br>are produced as a regult of elternative aplicing events. |  |
